

## Netafim USA Precision Irrigation

Automated irrigation can pay back on investment faster than any other nursery equipment purchase, usually in one season or less. A complete Netafim irrigation catalog is available upon request.

**Four Way MOD** - Designed for bench pot crops. Precise output volume allows for many units to be placed on bench with uniformity throughout the crop.

**Micronet Fogger** - Used for Propagation and Humidification. A 100 micron particle is produced at 60 psi. This is ideal for rooting of cuttings and seed germination. Leak prevention device creates instantaneous on-off for effective short cycling and minimizes dripping on crop below.

**Vibrospray** - Designed for overhead irrigation of bedding plants and pots crops. A precise pattern can be achieved to avoid dry areas at borders and overwet areas in center. Leak prevention device eliminates dripping after valve is closed.

**Spray Stakes** - Recommended where the primary means of fertilization is top dressing and where very coarse textured mixes are used.

**Dripperlines** - Very precise emitter volume insures uniformity throughout the block. A good solution to rodent related problems is presented when spaghetti tubing is used.
